

Automotive technologies of alternative propulsion and automated driving

Colloquium at the Department of Electrical Power Engineering
Brno University of Technology

Date:

28.11.2023

Host:

Assoc. Prof. Ing. Petr Baxant

Speaker:

Associate Prof. Dr. Mario Hirz
Institute of Automotive Engineering
Graz University of Technology

Associate Prof. Dr. Mario Hirz

Institute of Automotive Engineering

a: Inffeldgasse 11/2

p: 0316 873 35220

e: mario.hirz@tugraz.at

- PhD at the Institute of Internal Combustion Engines and Thermodynamics in 2005, habilitation at the Institute of Automotive Engineering in 2011, Associate Professor since 2016.
- Research topics include future mobility, sustainable transport, alternative powertrains & electric propulsion systems, new vehicle technologies, automotive mechatronics and virtual product development.
- Lecturer and researcher at Universities in the USA (Tampa, FL), China (Shanghai, Zhenjiang), Thailand (Bangkok), Saudi-Arabia (Riyadh), Slovenia (Maribor) and Innsbruck (Austria).
- Program Coordinator of the Double Degree Program Mechanical Engineering in co-operation with Tongji University, Shanghai, China.
- Scientific head of the university course Mechatronics Academy and the Mobility Module in the university course Leadership in Digital Transformation.

The transition in the automotive industry is driven by ...

- (1) Legislative boundary conditions targeting to a reduction of emissions
- (2) Digitalization & automation
- (3) New mobility concepts & business models

Legislative boundary conditions targeting to a reduction of emissions ... and driving electrification of propulsion systems

Legislative boundary conditions targeting to a reduction of exhaust emissions

Reduction of harmful exhaust emissions

- Hydro-carbons HC
- Carbon monoxide CO
- Nitro-oxygen NO_x
- Particulate emissions

Example: Limitation of NO_x-emissions in different markets

Reduction of greenhouse gases

e.g. EU “Green Deal” targets:

- CO₂ reduction of
- 50% in 2030
 - 100% in 2050

... in all branches.

Proposed technologies:

- “Green” electricity production
- Electrification of mobility (cars, trucks)
- Hydrogen as a fuel (cars, trucks, ships)
- Synthetic fuels (trucks, ships, aviation)
- Carbon capture & storage (industry)

Transport

Legislative boundary conditions targeting to a reduction of exhaust emissions

Emitted CO₂ – emissions in the EU since 1990 (1990 = 100%)

Reduction of greenhouse gases e.g. EU “Green Deal” targets:

- CO₂ reduction of
- 50% in 2030
 - 100% in 2050

... in all branches.

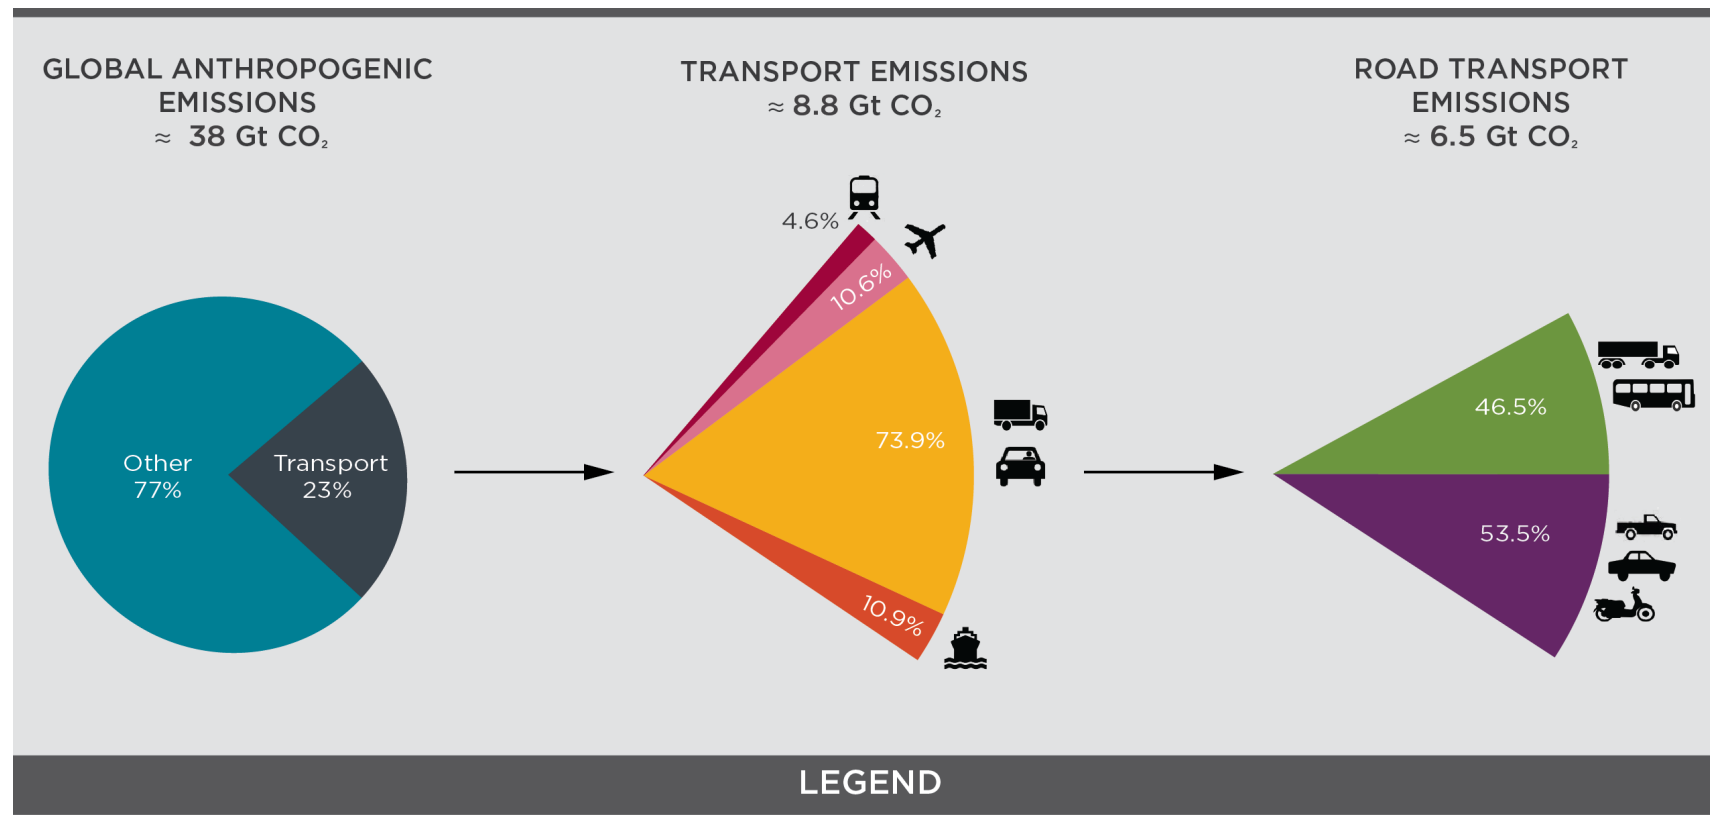

Proposed technologies:

- “Green” electricity production
- Electrification of mobility (cars, trucks)
- Hydrogen as a fuel (cars, trucks, ships)
- Synthetic fuels (trucks, ships, aviation)
- Carbon capture & storage (industry)

Transport

Source: EU, Transport & Environment

Worldwide CO₂-impact of the transportation sector

⇒ ca. 17% CO₂ from road transportation
 ... 8% CO₂ commercial transport
 ... 9% CO₂ individual mobility

Source: ICCT

Legislative boundary conditions: Trends of CO₂ fleet-emissions of personal cars

95 g/km CO₂ → 4.1 liter per 100km Gasoline
 → 3.6 liter per 100km Diesel fuel

59.4 g/km CO₂ → 2.6 liter per 100km Gasoline
 → 2.3 liter per 100km Diesel fuel

Penalty payments in the EU

Penalty payment for car manufacturer that do not reach the CO₂ - target:

- 95 € per Gramm CO₂ target violation per car sold and registered in the EU in a year
- Phasing-in regulations 2021 - 2023, special credits for eco-innovation
- Pooling is allowed (group-wide consideration)
- Reliefs for small manufacturers

Strategies of the automotive industry:

Short term (- 2027):

- Optimization of combustion engines
- “Smaller” combustion engines
- Electrification (HEV / PHEV / BEV)

Mid- / long term (2030 +):

- Electric cars
- Hydrogen vehicles
- Synthetic fuel applications

Comparison of propulsion technologies

Overview of propulsion technologies

Conventional drive systems

- + Established technologies, low costs
- + Quick fuel-filling, large driving distances
- + Potential for further improvements

- Thermodynamically bad efficiency
- Local exhaust emissions
- Direct dependency on crude oil (today)

Electric drive systems

- + Most efficient propulsion technology
- + No local emissions
- + Quiet technology, high driving comfort

- Expensive & complex battery systems
- Short driving distances, long charging times
- Environment-friendliness depends on the technology of electric power generation

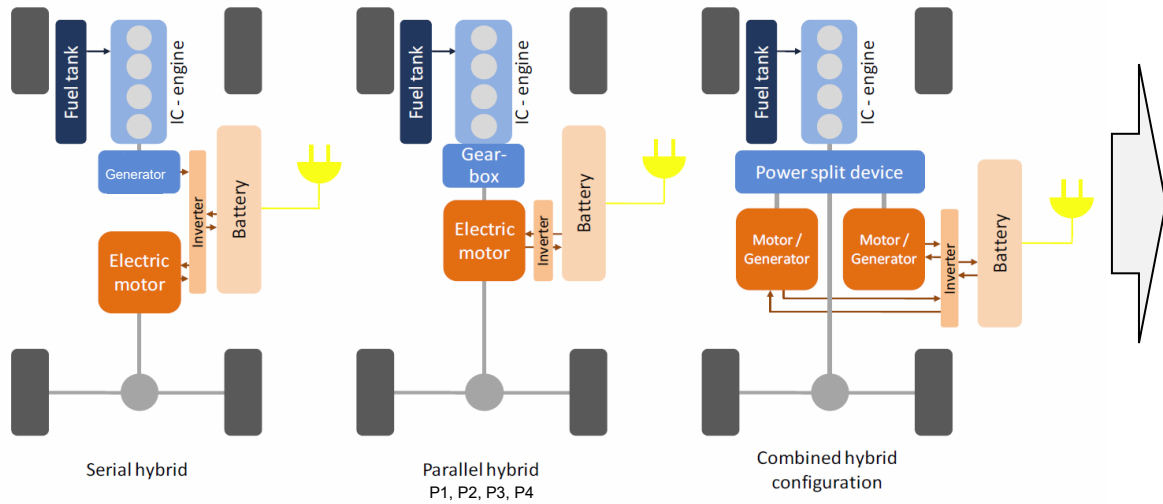

Hybrid drives

- + Combination of conventional and electric drive systems
- + Good efficiency possible
- + No driving range limitation
- + Specific test-procedures defined (for PHEV)

- Complex technology, integrating two propulsion systems
- CO₂ reduction potential is significantly influenced by user pattern / customer behavior

Architectures of hybrid- and battery-electric drive trains

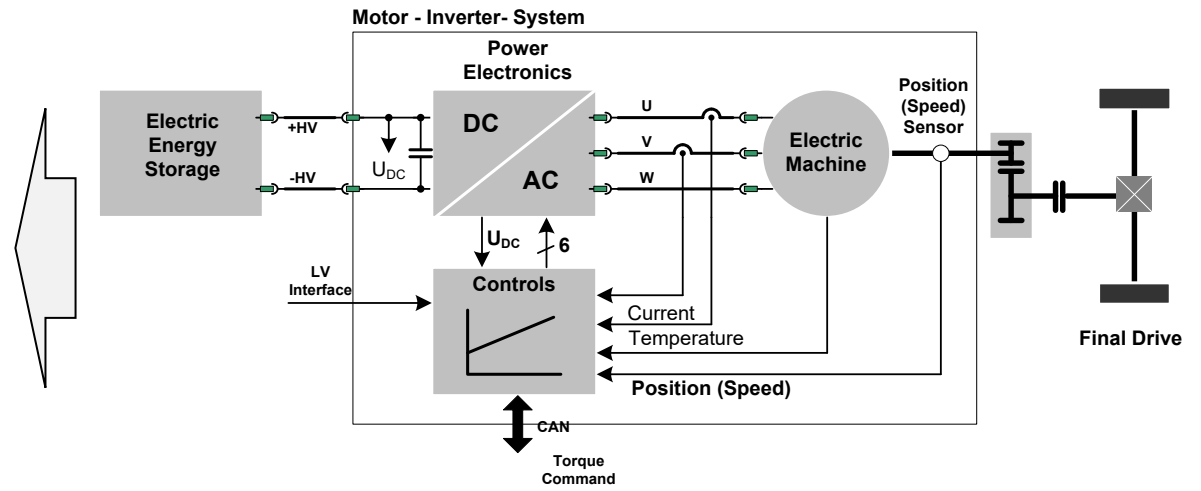

Overview of hybrid drive train configurations

- Different combinations of ICE and e-drive possible
- Different levels of hybridization (MHEV, HEV, PHEV)
- CO₂ – reduction potential between 5% and > 50%, depending on the user behavior

- Simple mechanical powertrain
- ... but complex E/E systems
- Key components:
 - Battery
 - Inverter
 - Electric motor

Battery-electric drive trains

Internal combustion engine vs. electric motor

ICE

E-Motor

Electric drive trains: reduction of complexity

ICE

BEV

ICE

- Crankcase
 - Crankshaft
 - Piston
 - Connecting rods
 - Running axles
 - Cylinder head
 - Valves
 - Camshafts
 - Camshaft adjustment
 - Bearings and lubrication
 - Cooling circuit
 - Supercharger
 - Motor control
- Gearbox**
- Casing
 - Gears
 - Switchgear
 - Ball bearing
 - Lubrication
 - Disc clutch
 - Hydrodynamic converter
- Fuel system**
- Tank
 - Fuel pump
 - Injection system
 - Performance system
- Exhaust System**
- Exhaust manifold / pipes
 - Three-way catalytic converter
 - NOx catalyst
 - SCR-System

Electric Motor +

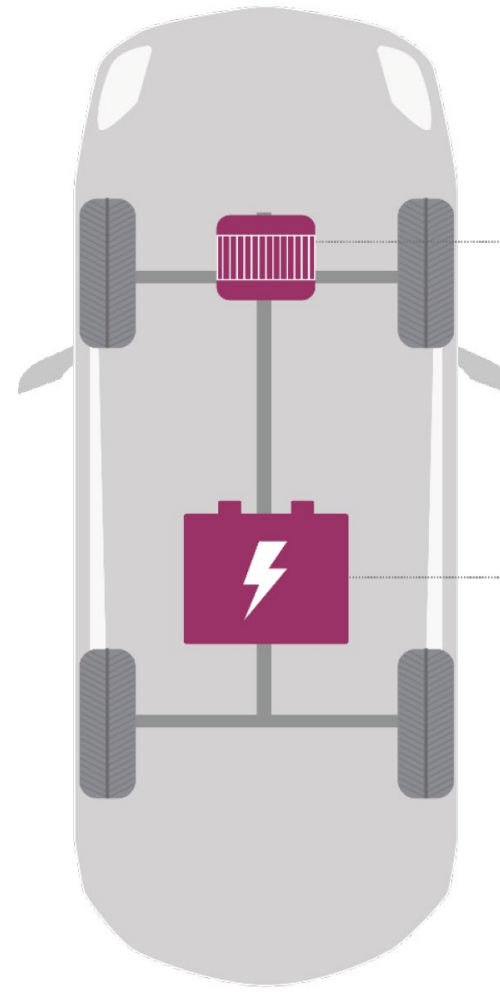

- Stator
- Rotor
- Inverter
- Charging technology

High-voltage system +

- Fuse protection / wiring
- DC-DC converter (12V)

Traction Battery +

- Battery cells
- Battery management
- Casing
- Charging unit

But: high effort for battery production

Cost comparison of propulsion technologies

Cost breakdown, compact SUV

CO₂ – impact of propulsion technologies

Well-to-tank & tank-to-wheel emissions

CO₂ equivalent emissions include:

- Production of fuel (electric energy): WTT (well-to-tank emissions) ... not considered in fleet-related CO₂-legislation
- Conversion of energy in the car: TTW (tank-to-wheel emissions) ... => fleet emission targets
- Sum of WTT & TTW: WTW (well-to-wheel emissions)

Key role: electric energy production

Different technologies have different CO₂-impact

Key role: electric energy production

Electricity mix in selected countries / regions

... a link to real-time data: <https://www.electricitymap.org/map>

Example:

Comparison of different propulsion technologies, WTT and TTW: Electric car vs. Gasoline / Diesel car

Remark: Calculation of CO₂ emissions out of fuel consumption by use of factor 26.2 for Diesel and factor 23.2 for Gasoline fuel: $\text{liter}/100\text{km} * \text{factor} = \text{CO}_2 \text{ [g/km]}$

Life-cycle - related consideration of technologies

Life-Cycle Assessment (LCA): Evaluation of technologies and products under consideration of the entire life-cycle (production, use-phase, end-of-life-phase). Standardized procedure, e.g. according to ISO 14040, ISO 14044.

Technical specifications

- Vehicle type, size, weight...
- Propulsion technology
- Vehicle technology
- Materials

Supply of resources and energy

- Type and amount of energy for production and use
- High-/low impact materials
- Raw-materials

Production and recycling technology

- Efficient production, supplier & logistics processes
- Design for recycling
- Recycling technologies

In-use phase

- Transportation demands
- User profiles, driving behavior
- Fuel- & energy consumption
- Maintenance & service effort

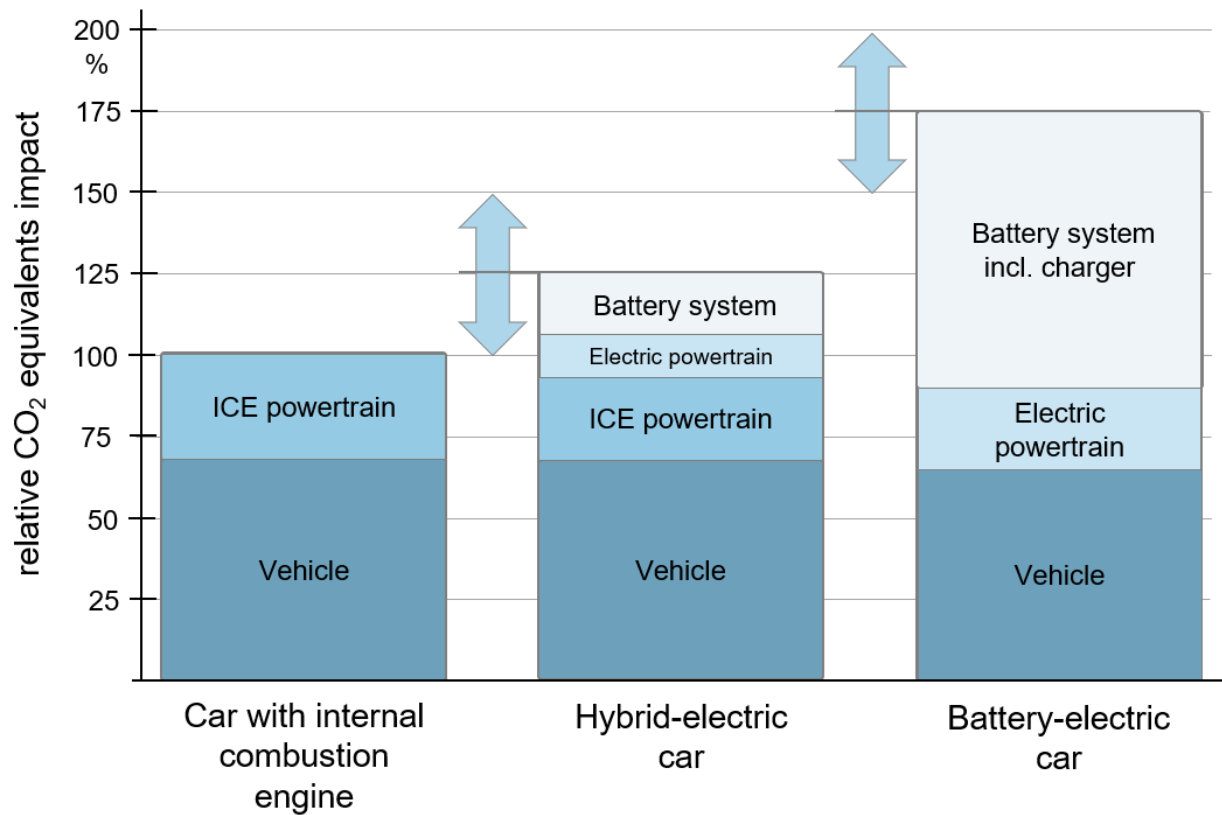

Life-cycle assessment – a tool for objective technology evaluation

Life-cycle - related consideration of technologies

CO₂ - impact of vehicle production in comparison

Influence of vehicle production

Comparison of mass-production compact cars with different propulsion technologies.

ICEV: Internal combustion engine vehicle

HEV: Full-hybrid vehicle

BEV: Battery-electric vehicle

	ICEV	HEV	BEV
Car type:	Compact car (C-class)	Compact car (C-class)	Compact car (C-class)
Vehicle mass:	1400 kg	1450 kg	1800 kg
Propulsion:	Gasoline engine	Comb. full hybrid, gasoline engine	Permanent magnets synchr. motor
Max. power:	90 kW	90 kW	110 kW
Fuel / energy consumption:	6 liter / 100 km	4.5 liter / 100 km	20 kWh / 100 km incl. charging losses
Battery capacity:	-	1.3 kWh	60 kWh
Country of battery cell production:	-	China	China
Country of vehicle manufacturing:	Germany	Japan	Germany
Car body main material:	Steel	Steel	Steel
Vehicle comfort equipment level:	Standard	Standard	Standard
Total carbon footprint of production:	7.5 tonnes CO ₂ equivalents	9.0 tonnes CO ₂ equivalents	14.0 tonnes CO ₂ equivalents

Total life cycle carbon footprint in comparison

Compact cars with different propulsion technologies

Alternative fuels: a possible solution?

Hydrogen: Fuel for a closed energy circle

in use today: commercial vehicles, trains, (cars)

Source: Hyundai

Source: Toyota

ships, (airplanes) ... research

Sources: ABB, NASA

Fuel-cell vehicles

Hydrogen is seen as the fuel for future mobility. Advantage is the potential for CO₂ emission free operation.

Fuel cell systems provide good efficiency behavior in comparison with internal combustion engines.

Main challenges for a broad application of hydrogen as fuel are hydrogen generation and storage.

Some numbers:

Hydrogen fuel consumption of a typical personal car: 0.7 – 1.6 kg/100km

Energy content of hydrogen: 120 MJ/kg = 33,3 kWh/kg

Hydrogen costs: 6 – 10 € per kg

CO₂ footprint of hydrogen production from natural gas: 8.5 – 11 kg CO₂ per kg H₂

CO₂ footprint of hydrogen production from wind / solar energy: potentially near zero.

Alternative fuels: a possible solution?

Synthetic fuels

State-of-the-art:

- GTL – gas to liquid: made of natural gas (methane, CH₄)
- CTL – coal to liquid: made of coal (historical)
- BTL – biomass to liquid: made of different bio-sources, e.g., ethanol, bio-diesel

In development with future potentials:

- PTL – power to liquid: fuel (hydrocarbons) made of H₂, CO₂ & CO by electrolytic conversion of water (production of H₂) and synthesis of CO₂ & CO.
 - + result is synthetic fuel that can have similar characteristics as gasoline or diesel.
 - + use of existing tank systems and infrastructure possible
 - + different application possible, e.g. cars, trucks, ships, airplanes, construction machines
 - + electric energy is needed (a lot); use of green electric energy results in sustainable fuel
 - + => CO₂ reduction out of the atmosphere ... theoretically CO₂ neutral fuel possible.
 - Worse production efficiency, high electric energy consumption
 - market-relevant volumes after 2030 expected (@ Shell)

Alternative fuels: a possible solution?

PTL – “e-fuels”

Prototype e-fuel production facility in Chile (Punta Arenas)
Partners: Siemens, Porsche, Gasco, Enap, Enel, ExxonMobil
Planned are 130.000 liter e-fuels per year

Process:

- (1) CO₂- neutral production of hydrogen, e.g. by electrolytic conversion of H₂O by use of wind- or water power
- (2) Extraction of CO₂ from processes of out of the atmosphere (direct air capture). Use of Ceramic filters, which bind CO₂, and subsequently performed periodic purging of the filters under heat.
- (3) Synthetic process for production of methanol (CH₃OH, respectively CH₄O).
- (4) Final synthetic processes methanol to gasoline => formation of the actual fuel.

Production of 1 liter e-fuel requires:

- 3 liter water
- + ca. 6000 m³ air for CO₂- extraction
- + ca. 16 kWh⁽⁺⁾ electric energy
- ... resulting in 8.5 kWh energy content per liter
(e-fuel as gasoline replacement)

Source: Porsche

Under “Green Deal” aspects: WTW-efficiency of different propulsion technologies

Assumption: renewable initial energy – the “green” way

Source: Transportation & Environment

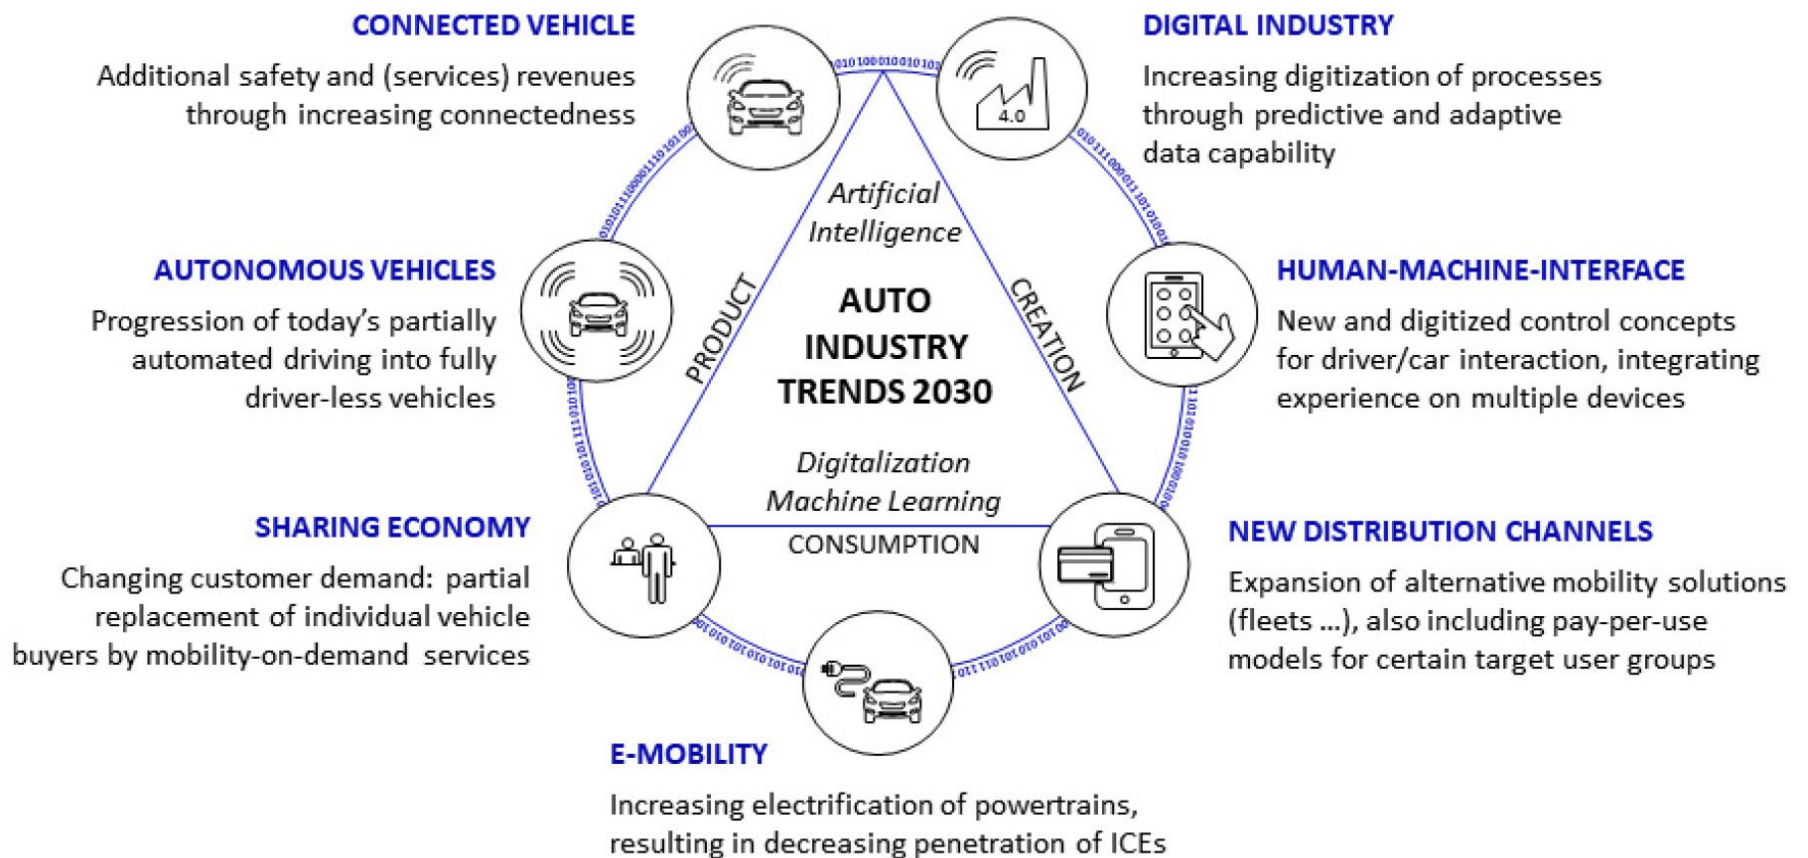

Discussion:

- Total efficiency
- Storage of (renewable) electric energy
- Transportation of energy
- Availability
- Effects on costs for energy / fuels vehicle technology infrastructure

Digitalization & automation

... enabling new mobility concepts & business models

Transition of the automotive industry is significantly influenced by digitalization

The car as a digital / mechatronics system

The most popular mechatronics system is the car. It consists of a multitude of mechatronics subsystems for engine & drive train management, communication, safety and comfort.

Engine / propulsion systems

- Electronic ignition systems
- Fuel injection systems
- Electronic idle speed control
- Air/fuel ratio (lambda) control
- Start / stop automatism
- Variable turbine geometry, boost pressure control (for charged engines) [e-supercharger]
- Variable valve control [e-phaser]
- Electronic engine cut-off (FUSI)
- Engine power control (electronic accelerator)
- Exhaust gas recirculation control
- Automated transmissions
- All-wheel drive
- Electric drive systems
- Hybrid drive systems
- Battery systems
- ...

Communication

- Radio
- Board computer
- Car telephone
- Control and information system
- New display technology
- Electronical voice output
- Function control through language
- Harness-multiplex-system
- Internet in cars
- Car 2x communication
- ...

Comfort

- Speed control
- Heating and AC control
- Seat adjustment with position memory
- Central lock
- Chassis control
- Automated driving functions
- ...

Vehicle safety

- Headlamps adjustment and cleaning
- Headlamps with gas discharge lamp
- Tyre pressure monitoring
- Anti- lock braking system (ABS), traction- control- system (ASR)
- System diagnosis
- Wipe-wash-control
- Load-dependent maintenance interval report
- Monitoring system for operating material and wear parts
- Release system for airbag, belt pretensioner, roll bar
- Anti-theft system
- Steering system for front and rear axle
- Adaptive cruise control (ACC)
- Lane assist
- Brake assist
- Automated driving functions
- ...

Focus: Automated / autonomous driving

Automated driving:

- **Traffic safety**
- **Comfort**
- **Ecological motivations**
- **Mobility for all**
- **Economical motivations**

Automated driving

Development is driven by tech-companies and some car manufacturers

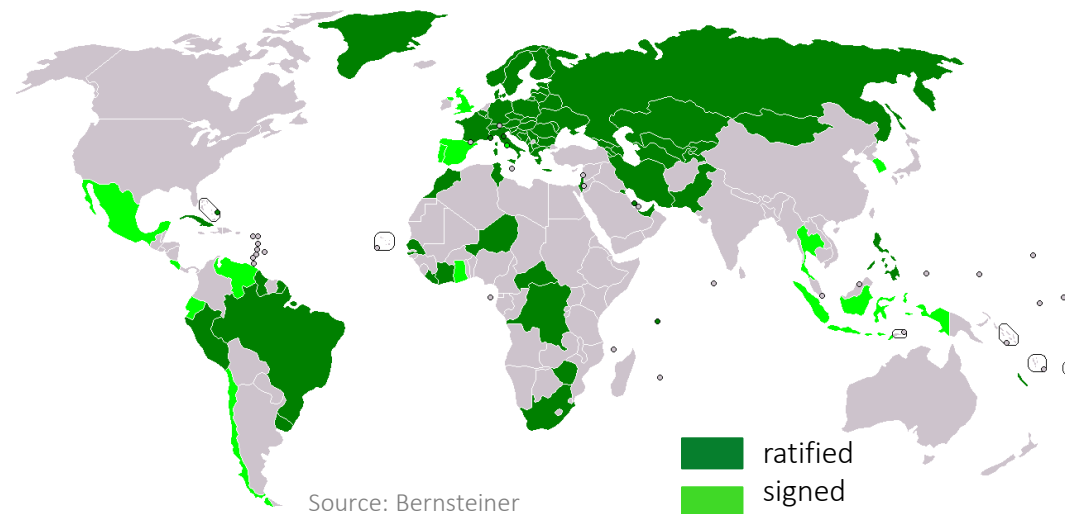

Expectations:

- Big business by increasing comfort, offering new services and having access to customer data
- Increase of safety (very likely) and reduction of traffic (to be discussed)

Challenges:

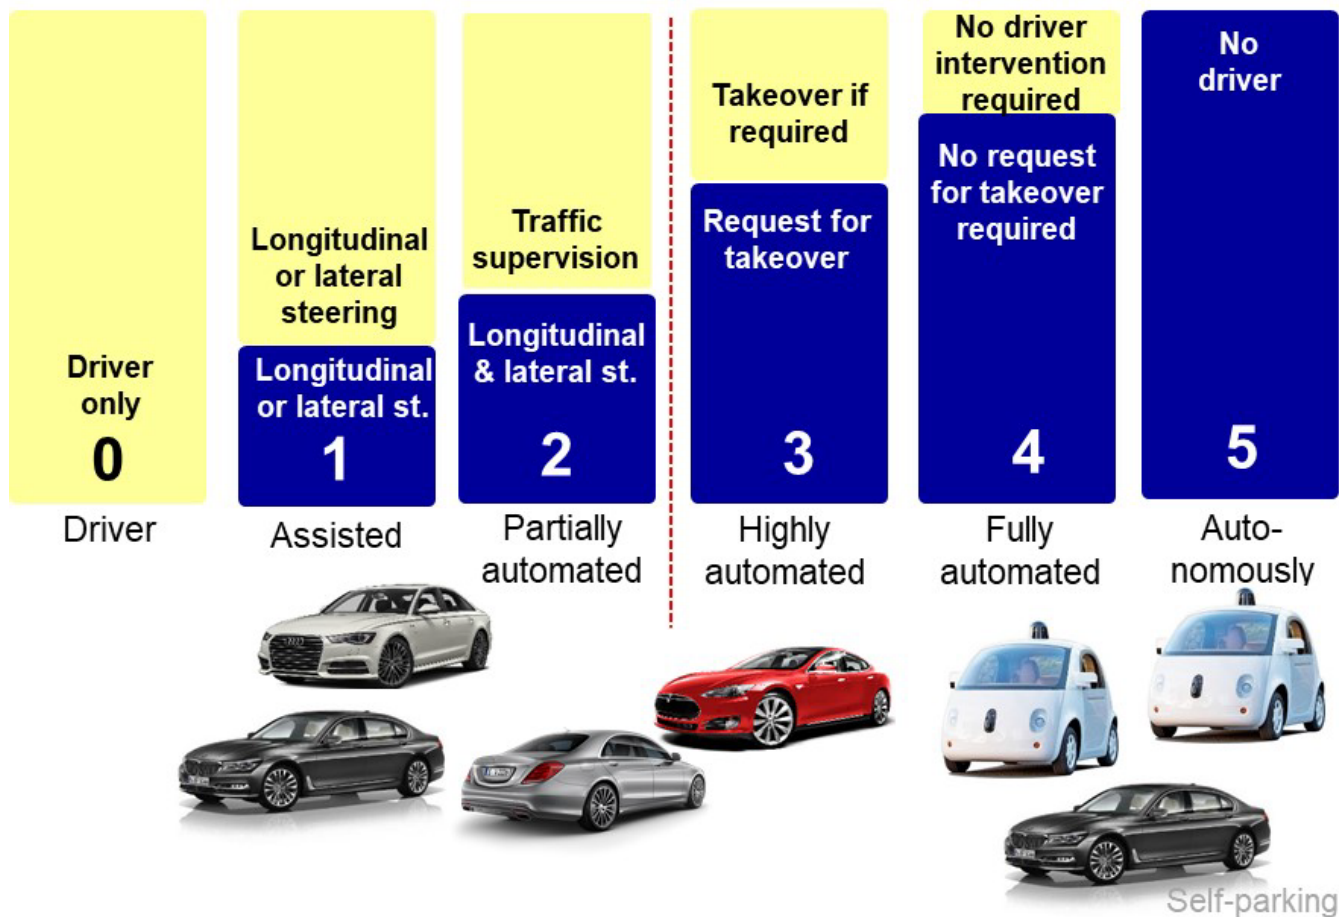

- Complex task, high technological effort
- Unclear legislative boundary conditions
- Issues in terms of responsibility and ethics questions

Vienna Convention: Driver's responsibility

Advanced Driver Assistance Systems (ADAS)

SAE / VDA – levels of automated driving

Tech-companies that invest in autonomous driving, e.g.:

... and of course car manufacturers, e.g.:

Tesla: "Autopilot" in Series => ca. Level 2.5

Mercedes Benz: Level 3 in mass production cars since 2022

VW Moia: Autonomous people mover fleet planned in Hamburg

...

New vehicle concepts

Sensors for ADAS

Source: VW, T. Form

- Vision systems
 - *Long range- & midrange-radar, laser scanner, 3D videocamera, topview-cameras, ultrasonic sensors, infrared (night view) ...*
- On-board sensors
 - *e.g. ESP: Lateral acceleration sensors, wheel speed, yaw rate, steering angle, brake system pressure sensor; ... , ambient temperature, air pressure, rain sensor ...*
- Further sensors / information sources
 - *Digital maps & GPS, Car2Car, Car2Infrastructure, Car2Home, ...*

Example: Waymo Driver Technology

Base vehicle

I-PACE (Model Year 2021)
Manufactured and sold by
Jaguar Land Rover (JLR)

Waymo Driver-ready vehicle

Waymo custom I-PACE
configuration built and
delivered by JLR

The Waymo Driver

Collections of custom
modules that collectively
make up the Waymo Driver

Final vehicle with the Waymo Driver

Final configuration of
the custom vehicle with
the Waymo Driver

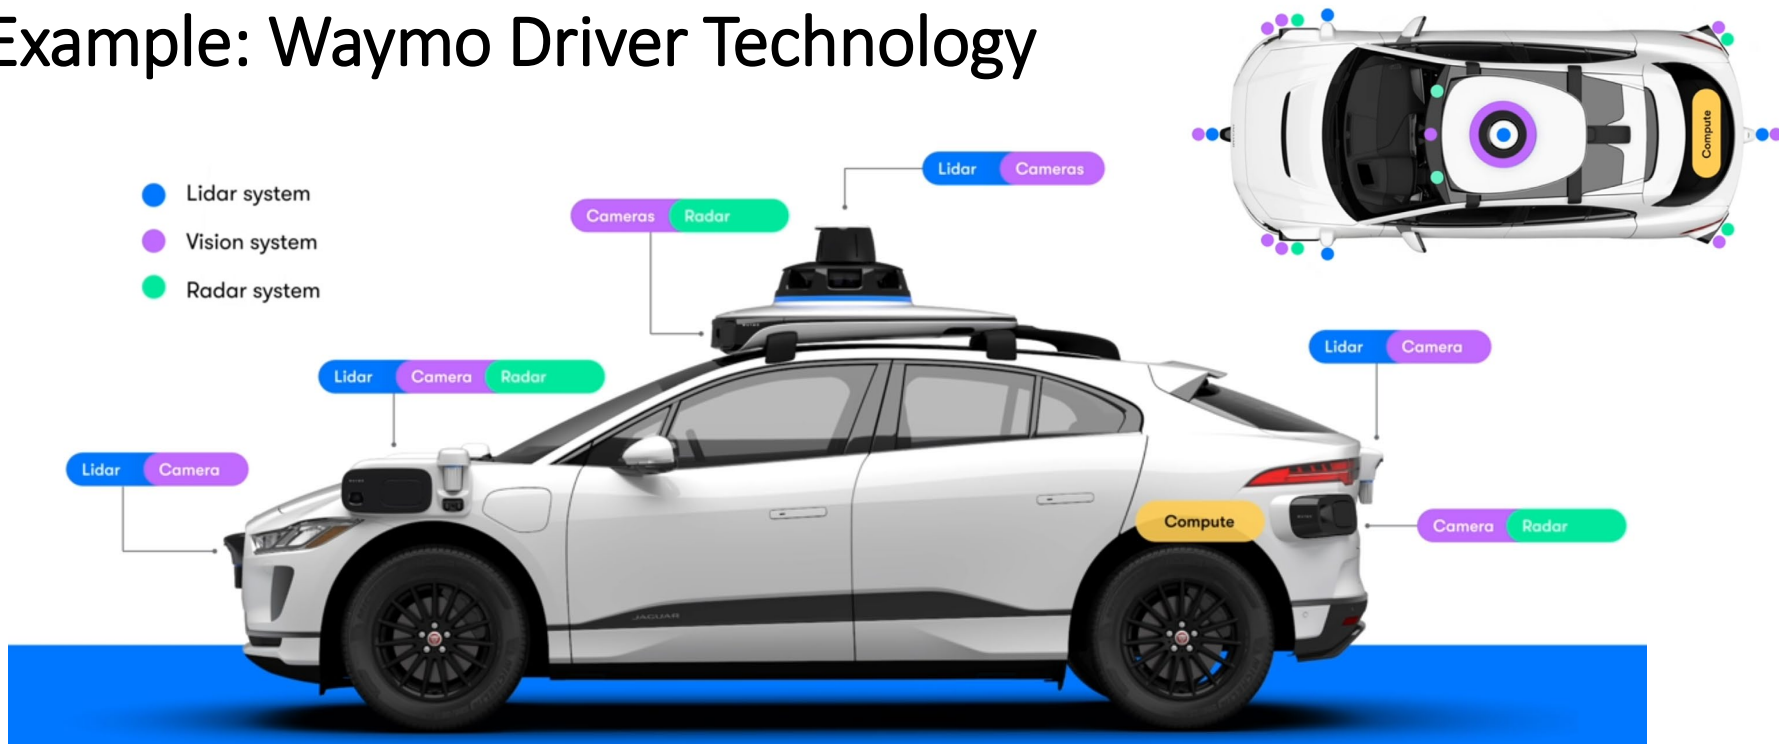

The Waymo Driver

Waymo Driver components

Source: Waymo

Example: Waymo Driver Technology

- 360° Lidar: max. 300m range, day & night applicability
- Perimeter Lidar: objects close to the vehicle
- 29 cameras: high resolution images, overlapping fields, equipped with cleaning systems and heaters
- 360° long range cameras > 500m range
- Perimeter cameras ... near field
- Radar: high resolution radars at 6 spots around the car. Complements the cameras and Lidars in bad weather conditions

Example: Waymo Driver Technology

Some detail views on the components

Roof unit:
 360° Lidar
 360° cameras
 Long range cameras
 2 Radars

Both side units:
 Radar, perimeter Lidar, cameras

Front unit: Perimeter Lidar, cameras

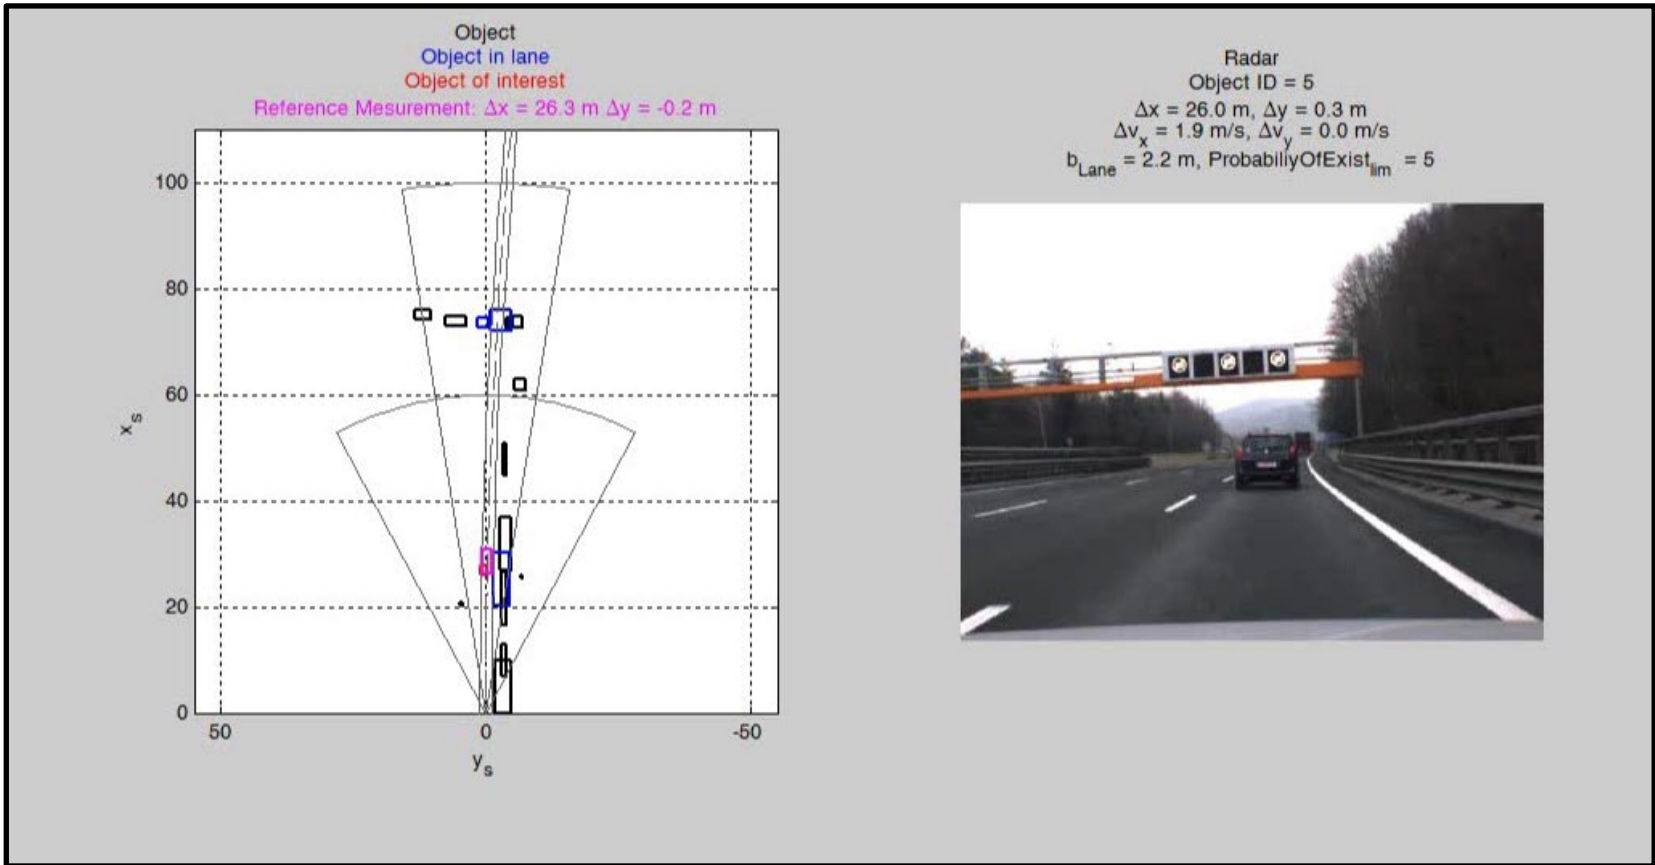

Rear side units:
